1. Introduction

Under Condition 10A of EirGrid's Transmission System Operator (TSO) Licence, and Condition 22A of SONI's Transmission System Operator Licence, the System Operator (SO) is required to report to the Regulatory Authorities (RAs) proposing values for parameters to be applied in the Scheduling and Dispatch process.

In May 2026 the RAs requested the TSOs to review the following parameters utilised in Scheduling and Dispatch:

1. Long Notice Adjustment Factor (LNAF)
2. System Imbalance Flattening Factor (SIFF)

On 17 July 2026, the RAs received a final report ([SEM-26-44a](#)) from the TSOs outlining their recommendations for the proposed values for the above parameters. The RAs then published a consultation on 10 August 2026 ([SEM-26-44](#)) on the TSO's recommendations. This paper presents the SEM Committee's decision in relation to these parameters, and is structured as follows:

Section 2: provides an overview of LNAF and SIFF.

Section 3: outlines the TSOs' proposal for 2027.

Section 4: provides a summary of respondents' comments.

Section 5: details the SEM Committee's decision.

Section 6: outlines next steps.

2. Background

The consultation paper ([SEM-26-44](#)) explained that LNAF and SIFF give effect to the objectives of Scheduling and Dispatch from the market design decisions, in particular, balancing the trade-off between ‘early’ energy-balancing actions and the cost of non-energy actions. LNAF is a multiplier applied to the start-up costs of Generator Units, which increases with increasing length of notice provided in any instruction to synchronise. SIFF is another multiplier applied to the start-up costs which reduces with reducing forecast system imbalance. The LNAF and SIFF terms are defined in the table below. The definitions are as outlined in the SONI and EirGrid Transmission Licences.

Table 1. Definition of LNAF and SIFF parameters

Term	Definition
LNAF	Long Notice Adjustment Factor – A multiplier applied to the start-up costs of generation sets which varies depending on the length of notice provided in any instruction from the Licensee to synchronise such generation set and which has greater values for greater lengths of notice.
SIFF	System Imbalance Flattening Factor – A multiplier applied to the start-up costs of generation sets which varies depending on the degree to which forecast generation including forecast imports and forecast exports on Interconnectors is short of forecast demand and which has greater values for greater shortages.

The consultation paper further explained that under Condition 10A of EirGrid’s Transmission System Operator (TSO) licence, and Condition 22A of SONI’s TSO licence, the TSOs are required, when directed to do so, to report to the Regulatory Authorities (RAs), proposing values for parameters to be applied in the Scheduling and Dispatch process.

3. TSO Proposals

The TSOs' report ([SEM-26-44a](#)) sets out the proposed values of LNAF and SIFF and the methodology for applying them in the scheduling tool. The TSO's have carried out a review of the scheduling processes based on the intent of the LNAF and SIFF parameters. The review focuses on the parameters in the context of current security of supply concerns, new operational trials and audit outcomes.

The LNAF applies a weighting to the costs of offline generators to reduce the likelihood of the scheduling tools recommending early commitment actions in the scheduling process. A value of zero for both LNAF and SIFF means there would be no additional weighted costs applied to offline generators and therefore no additional cost to the TSOs taking 'early' actions. Conversely, non-zero values of LNAF and SIFF would disincentivise the TSOs from taking 'early' energy balancing actions but may also increase the cost of non-energy actions. The intention with non-zero values of LNAF and SIFF would be to prevent the TSOs from taking actions on units prior to gate closure for energy balancing reasons. Such actions could foreclose the ability of participants to trade in the still-open intraday marketplaces to reduce energy imbalances.

The Scheduling and Dispatch Programme (SDP-02 Energy Storage Power Stations) went live in November 2025, integrating batteries into the real-time market and dispatch process. In their report the TSOs state that increased battery participation in the SEM is anticipated to further reduce the likelihood of the TSO optimisation tool scheduling early commitment actions during the scheduling process reducing the need of non-zero LNAF and SIFF.

The TSOs also note that one of the risks of assigning a non-zero value of LNAF and SIFF is the potential impact on securing the system as the few available offline long-notice units would run less, be in cooler heat states and thus less reliable to start when required. If some abnormal events occur such as tripping of a large unit, non-zero LNAF and SIFF would increase the reliance on the fewer short notice units that are not already committed. It would increase the risk of not meeting the demand requirements during start up periods of the long-notice units that are in cooler heat states, when they are called to replace the original tripped unit which could lead to a potential system alert.

The TSOs report also includes a note on non-market generation, highlighting its role in maintaining system adequacy during periods of tight margins. This includes units procured as Temporary Emergency Generation (TEG) and units retained under the Targeted Contracting Mechanism. These units will not participate in ex-ante markets and will only be dispatched when necessary to support system reliability, further reducing the relevance of applying non-zero LNAF and SIFF parameters. The increasing role of batteries and the growth of embedded and utility-scale solar generation are also expected to enhance system flexibility, reducing the need for early commitment actions by the TSOs.

Another finding from the analysis carried out by the TSOs relates to the fact that a number of transmission constraint groups (TCGs) have been put in place to manage tight generation margins over the last few years to improve the likelihood that generation is available during the period of peak demand for conventional generation. The TSOs' view is that these interventions are more significant and direct than the intent of LNAF and SIFF, and that non-zero LNAF and SIFF should not be used as an alternative to these interventions.

The TSOs' analysis also notes that since 31 December 2020, the day ahead market does not include any GB-SEM interconnection capacity. Due to this, the TSOs do not receive day ahead interconnector schedules for the Moyle, EWIC and Greenlink interconnectors. To mitigate the risk that imports to SEM are not scheduled in the Intraday markets at times of tight margins, the TSOs assume zero flows on the interconnectors in the day ahead scheduling. This may sometimes result in the TSOs scheduling the commitment of an additional long-notice unit. The TSOs point out that this procedure has a greater significance than what was envisaged during the design of the LNAF and SIFF parameters.

The TSOs' recommendation is that the LNAF and SIFF values remain unchanged from last year, at zero. This is summarised in the table below.

Table 2. LNAF and SIFF parameters – approved values for 2026 and proposed values for 2027

Parameter	Approved Value for 2026	TSOs' Proposed Value for 2027
Long Notice Adjustment Factor	0	0
System Imbalance Flattening Factor	0	0

4. Respondent's Comments

No responses were received to this consultation.

5. SEM Committee Decision

A summary of the decision made by the SEM Committee in relation to the LNAF and SIFF parameters are displayed in Table 3.

Table 3. LNAF and SIFF parameters – proposed and approved values for 2027

Parameter	TSOs' Proposed Value for 2027	SEM Committee Decision
Long Notice Adjustment Factor	0	0
System Imbalance Flattening Factor	0	0

The SEMC expects the TSOs to consider non-zero LNAF and SIFF values for 2028 and future reviews and where a zero value is proposed this should be backed by quantitative and qualitative analysis, and where there are barriers to non-zero values a plan to address those issues should be set out.

6. Next Steps

These parameters will apply from 01 January until 31 December 2027. A consultation will be carried out in 2027 to determine the values to apply from January 2028. The Trading and Settlement Code provides for the RAs amending the values of parameters where necessary outside the normal parameter-setting process. While this would only arise in exceptional circumstances, the SEM Committee has obligations to balance regulatory certainty with ensuring that no unnecessary consumer harm arises. On this basis, the RAs will keep these parameters under observation and may propose changes in the interim, if necessary, via consultation.
